QUESTION 1 — SAAS PRODUCTS MANAGED

Can you describe the SaaS products you have managed and your role in defining product strategy, roadmap prioritization, and customer adoption? What business outcomes were you responsible for?

I've spent the last eight years leading a product strategy across a portfolio for GovTech procurement platforms that competed directly with SAP Ariba in the public sector — serving large state and local government agencies operating under strict regulatory and compliance requirements. The platform suite included eProcurement, contract lifecycle management, supplier marketplace, cooperative contract reconciliation, and bid management products serving 500,000+ users.

At Periscope Holdings, I owned the full strategy-to-launch cycle for three net-new products. A transaction-based cooperative contract reconciliation platform that enabled \$18M in new customer revenue. A supplier portal rebuild that expanded subscriptions 17%. And a government-first enterprise contract-sharing marketplace built and launched in nine months. I also owned the SAP integration for our eProcurement product — a critical enterprise integration for agencies running procurement workflows inside SAP environments.

When Periscope was acquired by mdm Commerce and later rebranded as SOVRA, I was retained and expanded into a portfolio leadership role. I built and led a team of 30 — including Product Owners, UX/UI, Data Platform, Scrum Masters, and Tech Writers — and hired two Directors to established the company's first Tech PMO, onboarding 100+ globally distributed offshore contributors and creating the operating model that aligned delivery to executive priorities, AI strategy, and customer commitments. Across that period I governed roadmap and delivery across five platforms and 20+ products, led a \$10M capital improvement program spanning 50+ initiatives, and maintained stability across \$75M ARR while integrating AI capabilities into the product line.

Across all of it I was accountable for business outcomes: ARR retention, customer adoption, release velocity, and cross-functional alignment across product, engineering, sales, and customer success.

Holdings

Eight years across the same product family as the company evolved through two acquisitions. Direct SAP Ariba competitor in the public sector. Served large state agency procurement programs operating under strict regulatory compliance requirements. Two successful exits exceeding \$400M combined.

PRODUCT	PURPOSE	SCOPE / USERS
ePRO	End-to-end eProcurement / procure-to-pay automation for government buyers. Included a lightweight asset management module and SAP integration — owned the SAP integration as a product.	State & local government agencies; part of 500K+ user base
Marketplace	Public-sector ecommerce platform — government buyers shop co-op contracts, open market catalogs, and supplier catalogs. First-of-kind consumer shopping experience built for public sector compliance.	7,000+ government buyers
Reconciler	Automates cooperative contract fee collection — replaces manual, error-prone reconciliation workflows. Transaction-based revenue model.	Supported \$5M ARR; enabled \$18M new customer revenue
CLM	Contract Lifecycle Management — full contract authoring, execution, and post-award tracking integrated into procurement workflow.	Government procurement and legal teams
Bidnet Direct	eSourcing for smaller public sector agencies; access to 500K+ supplier database and electronic bidding. 100K+ government bids distributed monthly.	Small-to-mid government agencies across North America
S2G (Supplier-to-Gov)	Supplier-facing portal and bid aggregation — largest government bid database in North America. Subscription model for private sector suppliers seeking government contracts.	My rebuild guidance expanded subscriptions +17%

PRODUCT	PURPOSE	SCOPE / USERS
Verocity	Core cloud-based background check workflow automation platform — the legacy primary product I led the modernization, transitioning to API-driven architecture.	43K business customers; 4.1M annual hires processed
Verocity Integration Manager	Self-service integration platform replacing custom integrations. Led the replacement of a custom platform supporting 40 HRIS vendors with MuleSoft.	40+ HRIS vendor integrations (ADP, iCIMS, etc.)
SwiftHire Mobile	Mobile background screening app — applicants complete forms, digital signatures, and status tracking from mobile device. Gig workforce onboarding use case.	Led the launch of this product — delivered \$90K under budget

Fluid Innovation Ventures 2008 – 2016 · Venture Studio · Austin

Five startups designed, directed, and launched. Three successful exits.

PRODUCT	PURPOSE	OUTCOME
IP Zone	IP commercialization workflow platform — patent holders manage licensing, enforcement, and monetization workflows.	Acquired by American Express
idealAsset	Intellectual property marketplace — connecting IP buyers and sellers.	Acquired by Dominion Harbor Group
Enlyton	Pre-AI semantic search and research engine — early natural language processing for enterprise research workflows.	Integrated into IBM Watson partner solutions
FranchiseProcess	Online course and learning center for franchise companies.	Dissolved
Pay You First	Online directive to assist the under-banked.	Dissolved

PRODUCT	PURPOSE	STATUS
DeepBench	Production multi-agent AI workforce platform — multi-agent orchestration, RAG pipeline, ReAct autonomous web agent, LLM evaluation framework.	Live at deepbench.roadmapventure.com
Techson IP	B2B patent intelligence and research platform.	Continued as sustainable small business post-engagement
Solcharge	B2C ML-enabled mobile SaaS platform — early machine learning application.	Consumer mobile launch

QUESTION 2 — AI-ENABLED PRODUCTS

Have you led the development of AI-enabled products or features? Please describe the solutions you helped create, your role in defining the strategy and execution, and the business value or outcomes these initiatives delivered.

Yes — and this is an area I've invested in deeply, both in my day job and through independent applied research.

At SOVRA, I led the production release of our GenAI feature integration within BidNet Direct, which was part of our \$10M capital improvement program. Also with AI transformation by the product team: introducing LLM-assisted requirements and design generation into our development workflow, compressing the design-to-engineering handoff from weeks to days. I also architected the strategy for a lakehouse data platform — unifying 14TB of product and user data — specifically to enable AI-driven product capabilities and future data monetization. AI wasn't a feature we bolted on; it was a deliberate architectural layer I planned from the data foundation up.

Beyond my corporate roles, I designed and directed the build of DeepBench — a production multi-agent AI workforce platform — live and continuously shipping. The system includes multi-agent orchestration with specialized domain analyst agents, a RAG pipeline with semantic vector retrieval, a ReAct autonomous web agent that perceives, decides, acts, and writes knowledge back to a database — self-improving without retraining — and an LLM evaluation framework with per-step confidence scoring and full agent run logs for auditability.

The reason I built it: I believe the next generation of enterprise software — including industrial asset management — will be built around AI agents performing complex domain work. I wanted to be able to architect and direct that, not just describe it. DeepBench is the proof. For a company like SIGGA, where the opportunity is embedding AI into SAP-native maintenance and field workforce workflows, that combination of enterprise product leadership and hands-on AI architecture fluency is the direct value I'd bring.

The platform is live at deepbench.roadmapventure.com.

CAPABILITY	DESCRIPTION	ROLE REQUIREMENT MATCHED
Multi-agent orchestration	Agents with domain, web agent, each with distinct roles, trainable via RAG, composable into task workflows.	Build multi-agent systems / complex LLM orchestration
RAG pipeline	pgvector semantic retrieval — domain knowledge stored as embeddings, retrieved at runtime and injected into agent prompts.	LLM apps: RAG, tool use, agent orchestration
ReAct autonomous agent	Browser perception → Claude decision → Playwright action → knowledge write-back to Supabase. Self-improving without retraining.	Ship products that drive real business impact
LLM evaluation framework	AI Audit screen with per-step confidence scoring and full agent run logs. Monitors production accuracy and drives prompt iteration cycles.	Build evaluation frameworks for LLM outputs
Human-in-the-loop design	Step gate logic — humans approve or intervene at defined checkpoints before agents proceed.	Consider how tools affect existing workflows end-to-end
Deterministic + generative hybrid	Domain logic as primary analytical layer, LLM as intelligence layer over pre-computed findings. Deliberate differentiator from pure LLM products.	Identify where AI creates leverage vs. noise
Full-stack delivery	Supabase → Railway → React frontend. Designed and directed end-to-end as a non-coder product executive.	Full-stack: data pipelines through user interfaces

AI at SOVRA / mdm Commerce

2025 – 2026 · Enterprise SaaS portfolio

INITIATIVE	WHAT IT WAS	OUTCOME
LLM-assisted requirements	Introduced LLM-generated requirements and design specifications into the product development workflow across 5 platforms.	Compressed design-to-engineering handoff from weeks to days
GenAI product feature integration	Led AI feature delivery across the \$10M capital improvement program — 50+ initiatives including GenAI feature rollouts.	AI capabilities shipped across 20+ products
Lakehouse AI strategy	Architected the data platform strategy unifying 14TB of product and user data to enable AI-driven capabilities and future data monetization.	Foundation for AI product features and data revenue layer

QUESTION 3 — SAP / EAM EXPERIENCE

Have you had direct, hands-on experience with SAP, Enterprise Asset Management (EAM) solutions, or industrial environments, rather than just exposure to these areas? If so, please describe your role and the industries or customers you supported.

My SAP and EAM experience is adjacent:

On the SAP side: I owned the SAP integration for our eProcurement platform at Periscope, which required understanding how government agencies ran procurement workflows inside SAP environments and how our product needed to connect to and complement that infrastructure. SAP Ariba was our primary enterprise competitor, so I spent years understanding that ecosystem from a product and customer displacement perspective.

On the asset management side: earlier in my career, before moving into SaaS product leadership, I was a GIS systems consultant implementing municipal technology for the City of Kansas City. That work included implementing and integrating Intergraph's MGE platform — one of the early enterprise asset management systems used for municipal infrastructure — as well as Accela, an ERP and permitting platform for city operations, for which I wrote the GIS integration layer. Those were hands-on implementations in regulated government operational environments.

What I do bring is 20+ years of building software for complex operational workflows in highly regulated, enterprise and b2b environments, a track record of rapidly entering new domains and delivering outcomes, and the AI architecture depth to help SIGGA build the next generation of intelligent maintenance capabilities — which based on the job description appears to be a core part of what this role is meant to drive.

I'm capable to fastrack domain understanding — my track record across GovTech, procurement, IP commercialization, background screening, and AI platforms reflects that consistently. I'm confident the SAP and industrial context would come quickly, and I'd bring immediate value on the product strategy, AI roadmap, and team leadership dimensions from day one.

SAP & EAM-Adjacent Experience

Across career — direct and adjacent touchpoints

PLATFORM / SYSTEM	ROLE & CONTEXT	ERA
SAP Integration (ePRO)	Product owner of the SAP integration for Periscope's eProcurement platform. Designed how government agencies running SAP connected to and transacted through the procurement suite.	2018 – 2021
SAP Ariba (competitor)	8 years of product strategy directly competing with SAP Ariba in the public sector. Deep understanding of the SAP procurement ecosystem from a product differentiation and customer displacement perspective.	2018 – 2026
Intergraph MGE	Implemented and integrated Intergraph's MGE platform — one of the earliest enterprise asset management systems — for municipal infrastructure asset tracking at the City of Kansas City.	Pre-2008
Accela (formerly KIVA)	Implemented Accela as an ERP and permitting platform for city government operations. Authored the GIS integration layer connecting Accela to spatial data systems.	Pre-2008
ESRI ArcGIS	Sold and implemented ESRI's enterprise GIS platform for municipal and government clients — spatial data analysis, infrastructure mapping, and field operations.	Pre-2008
SAS	Sold and implemented SAS enterprise analytics and business intelligence platform for government and enterprise clients.	Pre-2008
